"The Mark of Value  
Added Intelligent  
Lifting Hardware"

## Crosby's Patented RFID Inspection System

The QUIC-CHECK® inspection and identification system is so advanced that it is protected by a US patent.

*the only RFID system*

Crosby® has been developing "intelligent lifting hardware" for years to help end-users stay in compliance. The new patented RFID inspection system makes that much easier.

Our patent went into effect September 1st, 2010. The primary focus of the patent is to provide applicable information from ASME, EN and the manufacturer's specifications and standards, that can be used to train the user on the proper use of the respective lifting products (i.e., chain/wire rope/synthetic slings, shackles, blocks and other associated components).

Our patented QUIC-CHECK® Inspection and Identification System Software combines RFID technology with a hand held

device to make identifying, inspecting and recording data quick and accurate.

Benefits of the system include:

- Meets ASME B30.9, ASME B30.26 and EN inspection criteria
- Efficient, accurate and timely inspections
- Eliminates handwriting of information
- Provides instant reference "Cradle to Grave"
- Reduces inspection cost and time
- Accurate and timely inspection reports

Ask your authorized Crosby Dealer about the Crosby® products that are RFID EQUIPPED.

*After years of development, Crosby® offers the only patented RFID software available for the rigging hardware.*
